BREAK FEED TROUGH

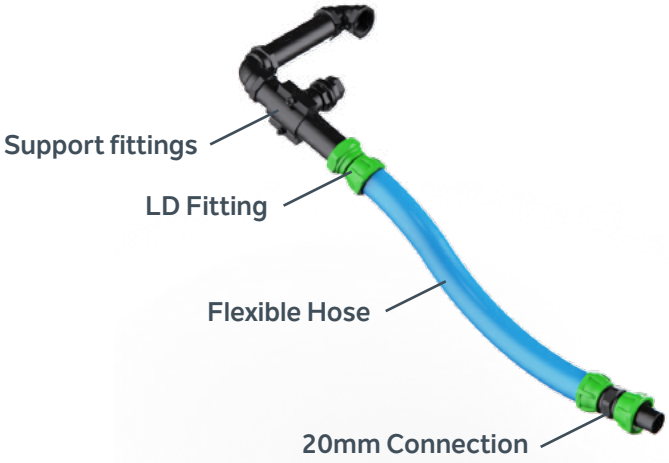
No more leaks and prevents pugging during the winter grazing season.

RXP

by aliaxis

BREAK FEED SOLUTION.

With break fed wintering regulations cows require water troughs to be more accessible and close. This helps cows preserve energy during the winter periods. RXP has come up with a solution using a float valve support onto our trough to reduce leaking and prevent cows from standing on the pipe creating movement.



Features

Comes with a float valve support kit already installed. Provided with 20mm LD Pipe 50m coil. Support kit secured under the lip of the trough to prevent pipe movement causing leaks around the valve.

Benefits

- Prevents leaking around the valve
- Reduces pugging
- Reduces animal energy output walking to trough
- Large trough opening to fit more cows at once
- Protects valuable topsoil
- Reduces losses of nutrients in the soil
